		James M F		2612				
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply								
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). - Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status

DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1: Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 2002/0118291 Ishigami et al.
- As for Claim 1, Ishigami et al teaches in Figure 9 and on Paragraph [0075] a solid-state image pickup apparatus comprising: an image pickup section (1); and a signal feeding section (the signal feeding section is viewed by the examiner as the circuitry that supplies the drive pulses to both the vertical shift register and the horizontal shift register); said image pickup section comprising: photosensitive cells arranged bi-dimensionally (2), each being shifted from adjoining photosensitive cells in a horizontal and vertical direction, for photoelectrically transducing incident light; Paragraph [0075] The shifting is performed using the vertical and hirizontal CCD registers. Ishigami et al teaches on Paragraph [0115-0116] that the color filters are red, green, and blue color filter segments, each being positioned in front of a particular photosensitive cell in a direction of light incidence, for separating colors of incident light representative of a scheme. Ishigami et al teaches on Paragraph [0075] the use of transfer electrodes (3), each being assigned to a particular photosensitive cell, for reading out a signal charge generated by said photosensitive cell, said transfer electrodes being assigned to vertical transfer paths and a horizontal transfer path substantially perpendicular to the vertical transfer

Art Unit: 2612

mixing of the colors.

paths. The read out gates are viewed by the examiner as the transfer electrodes for each pixel. Ishigami et al teaches on Paragraph [0005] control circuitry for sequentially performing preliminary pickup and actual pickup, which reads all of the signal charges out of the photosensitive cells, and executing digital signal processing with resulting signals; preliminary pickup mode is viewed by the examiner as the mode in which the horizontal register is driven using the driving pulses as depicted in Figure 11. Actual pickup mode is viewed as the mode in which the four-phase driven horizontal register is driven as a two-phase register by driving the phases in the manner as depicted in Figure 13. The digital signal processing is viewed by the examiner as the process for performing (AWB, AE, and AF). Ishigami et al teaches the use of capturing a preliminary image for performing (AWB, AE, and AF) before an actual image pickup is performed. Ishigami et al teaches on Paragraph [0115-0116] said signal feeding section feeding transfer timing signals for transferring signal charges generated by only part of said photosensitive cells arranged on odd-numbered columns or even-numbered columns to the vertical transfer paths via said transfer electrodes associated with said part of said photosensitive cells, the vertical drive signals for transferring said signal charges along said vertical transfer paths toward the horizontal transfer path, Ishigami et al teaches that in the case of a color image

Page 3

Ishigami et al depicts in Figure 14 that the image sensor has Red, Green, and Blue Pixels.

Ishigami et al teaches in Paragraph [0115] that the colors can be arranged in various patterns.

sensor it is important not to mike the color signals output from the pixels. Therefore, driving

pulses are supplied so that every other column of pixel data can be output in order to prevent

Art Unit: 2612

However, Ishigami et al does not specifically state that the colors can be arranged each being arranged in a vertical stripe pattern.

Official notice is taken that it was well known in the art at the time the invention was made to manufacture image sensors so that the colors were arranged each being arranged in a vertical stripe pattern in order to only have one color for any given column to decrease the complexity of the color separation circuitry.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to arrange the color filters of Ishigami et al arranged in a vertical stripe pattern in order to only have one color for any given column to decrease the complexity of the color separation circuitry.

- 3: In regards to Claim 2, Ishigami et al teaches on Paragraph [0083] wherein in the event of the preliminary pickup said signal feeding section outputs said horizontal drive signals such that a well is formed in each packet of said horizontal transfer path adjoining a packet storing the individual signal charge at the same time as a well formed in said packet storing said individual signal charge. The preliminary pickup mode is viewed as the mode when the four-phase driven horizontal register is driven as depicted in Figure 11. Because the Phases (H1b and H2a) are in common for a period of time and Phases (H1a and H2b) are in common for a period of time, a well is formed in each packet of said horizontal transfer path adjoining a packet storing the individual signal charge at the same time as a well formed in said packet storing said individual signal charge.
- 4: As for Claim 3, Ishigami et al teaches on Paragraph [0083] wherein said signal feeding section outputs said horizontal drive signals such that a range of said horizontal transfer path

Art Unit: 2612

driven in a same phase and derived from an electrode structure of said horizontal transfer path is doubled.

- 5: In regards to Claim 4, Ishigami et al teaches on Paragraph [0083] and depicts in Figures 13 and 14 wherein when said horizontal transfer path has a four-electrode structure, said signal feeding section outputs said horizontal drive signal such that two phases are combined into a single phase.
- As for Claim 5, Ishigami et al teaches in Figure 9 and on Paragraph [0075] a method of 6: reading signal charges generated by photosensitive cells (2), which are arranged bidimensionally and each is shifted form adjoining photosensitive cells in a horizontal and a vertical direction for photoelectrically transuding light of particular separated color incident thereto, in a particular manner for preliminary pickup and actual pickup, which reads all of said signal charges out of said photosensitive cells for recording said signal charges said method comprising the steps of: Ishigami et al teaches on Paragraph [0115-0116] positioning in front of said photosensitive cells in a direction of light incidence a color filter, in which three primary colors R.G. and B. for separating incident light, and forming transfer electrodes each being assigned to a particular photosensitive cell for reading out a signal charge generated by said photosensitive cell, said transfer electrodes respectively contacting said photosensitive cells; Ishigami et al teaches on Paragraph [0075] the use of transfer electrodes (3), each being assigned to a particular photosensitive cell, for reading out a signal charge generated by said photosensitive cell, said transfer electrodes being assigned to vertical transfer paths and a horizontal transfer path substantially perpendicular to the vertical transfer paths; The read out gates are viewed by the examiner as the transfer electrodes for each pixel. (b) generating drive

Page 6

signals for reading out the signal charges generated by said photosensitive cells and representative of an image pickup; (the signal feeding section is viewed by the examiner as the circuitry that supplies the drive pulses to both the vertical shift register and the horizontal shift register) The read out gates are viewed by the examiner as the transfer electrodes for each pixel. Ishigami et al teaches on Paragraph [0005] control circuitry for sequentially performing preliminary pickup and actual pickup, which reads all of the signal charges out of the photosensitive cells, and executing digital signal processing with resulting signals; preliminary pickup mode is viewed by the examiner as the mode in which the horizontal register is driven using the driving pulses as depicted in Figure 11. Actual pickup mode is viewed as the mode in which the four-phase driven horizontal register is driven as a two-phase register by driving the phases in the manner as depicted in Figure 13. he digital signal processing is viewed by the examiner as the process for performing (AWB, AE, and AF). Ishigami et al teaches the use of capturing a preliminary image for performing (AWB, AE, and AF) before an actual image pickup is performed. Ishigami et al teaches on Paragraph [0115-0116] said signal feeding section feeding transfer timing signals for transferring signal charges generated by only part of said photosensitive cells arranged on odd-numbered columns or even-numbered columns to the vertical transfer paths via said transfer electrodes associated with said part of said photosensitive cells, the vertical drive signals for transferring said signal charges along said vertical transfer paths toward the horizontal transfer path, Ishigami et al teaches that in the case of a color image sensor it is important not to mike the color signals output from the pixels. Therefore, driving pulses are supplied so that every other column of pixel data can be output in order to prevent mixing of the colors.

Art Unit: 2612

Ishigami et al depicts in Figure 14 that the image sensor has Red, Green, and Blue Pixels. Ishigami et al teaches in Paragraph [0115] that the colors can be arranged in various patterns. However, Ishigami et al does not specifically state that the colors can be arranged each being arranged in a vertical stripe pattern.

Official notice is taken that it was well known in the art at the time the invention was made to manufacture image sensors so that the colors were arranged each being arranged in a vertical stripe pattern in order to only have one color for any given column to decrease the complexity of the color separation circuitry.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to arrange the color filters of Ishigami et al arranged in a vertical stripe pattern in order to only have one color for any given column to decrease the complexity of the color separation circuitry.

7: In regards to Claim 6, Ishigami et al teaches on Paragraph [0083] wherein in the event of the preliminary pickup said signal feeding section outputs said horizontal drive signals such that a well is formed in each packet of said horizontal transfer path adjoining a packet storing the individual signal charge at the same time as a well formed in said packet storing said individual signal charge. The preliminary pickup mode is viewed as the mode when the four-phase driven horizontal register is driven as depicted in Figure 11. Because the Phases (H1b and H2a) are in common for a period of time and Phases (H1a and H2b) are in common for a period of time, a well is formed in each packet of said horizontal transfer path adjoining a packet storing the individual signal charge at the same time as a well formed in said packet storing said individual signal charge.

Application/Control Number: 09/657,413 Page 8

Art Unit: 2612

8: As for Claim 7, Ishigami et al teaches on Paragraph [0083] wherein said signal feeding section outputs said horizontal drive signals such that a range of said horizontal transfer path driven in a same phase and derived from an electrode structure of said horizontal transfer path is doubled.

9: In regards to Claim 8, Ishigami et al teaches on Paragraph [0083] and depicts in Figures 13 and 14 wherein when said horizontal transfer path has a four-electrode structure, said signal feeding section outputs said horizontal drive signal such that two phases are combined into a single phase.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. USPN 5,591,660 Fujikawa et al teaches the use of an image sensor with horizontal and vertical read out registers; USPN 5,485,204 Taniji teaches the use of an image sensor with a four-phase driven horizontal shift register; USPN 5,686,742 Takeuchi teaches the use of an image sensor having a high charge transfer efficiency; USPN 5,894,143 Tanigawa et al teaches the use of an image sensor having a four-phase driven horizontal register; USPN 5,591,660 Fujikawa et al teaches the use of an image sensor as depicted in Figure 2.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to James M Hannett whose telephone number is 703-305-7880. The examiner can normally be reached on 8:00 am to 5:00 pm M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wendy Garber can be reached on 703-305-4929. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9314.
